

The pick point is the point furthest from any edge, not the centre of mass

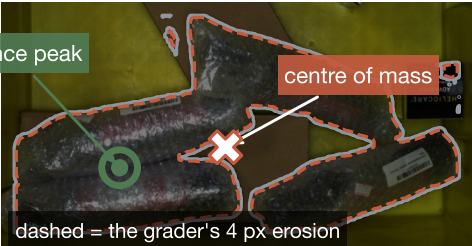

an item this pipeline detected

distance to the nearest edge

centre of mass vs distance peak

Across the split, a centre of mass lands outside its own mask on 39 of the 637 masks this pipeline detects (6.1%) once the grader's 4 px erosion is applied. 28 of those masks are a single connected piece, so the miss is the item's shape rather than a fragmented mask. The distance-transform peak misses 0 of 637.
